

Back End code challenge

We would like you to create a simple REST API that allows to:

1. get a list of medications
2. create a new medication
3. delete a medication

REQUIREMENTS:

- Each medication must have a name, a quantity and a creation date:
 - The quantity must be greater than zero
- You can use the database technology of your preference
- The project must be written in C# using .Net Core
- The project can optionally include an example unit test
- The project can be under a git repository and to deliver it, send us an email with a link to a repo on GitHub, Bitbucket or GitLab

Thank you
